About Swagelok Company

Swagelok Company is an approximately \$2 billion privately held developer of fluid system products, assemblies, and services for the oil and gas, chemical and petrochemical, semiconductor, and transportation industries. Headquartered in Solon, Ohio, U.S.A., Swagelok serves customers through 200 sales and service centers in 70 countries, supported by the expertise of 5,500 corporate associates at 20 manufacturing facilities and five global technology centers.

For more information or assistance please contact your authorized Swagelok sales and service center or visit our website at www.swagelok.com.

Introduction

Thread and End Connection Terminology

Standards are used to help identify threads and end connections. We will use the following definitions in this manual:

Thread Standard

A specific reference to a formal standard (for example, ASME B1.1, EN 10226-1, or ISO 261) that describes thread form, including a thread's angle, pitch, and diameter.

End Connection Standard

A specific reference to a national standard (such as DIN 3852 or JIS R and JIS Rc) or industry group standard (such as SAE J512) that describes an end connection's components, seal area, geometry, and nominal sizes. Thread standards are usually referenced in the end connection standard.

Thread Standards and End Connection Standards

Many mechanical end connections have threads. Therefore, thread standards can be used to help define end connection standards.

Pitch

For the purposes of this guide, pitch refers to threads per inch, instead of the distance between the threads, for fractional screw threads and pipe threads. For all metric screw threads, pitch refers to the distance between adjacent threads.

General Terminology

General terms and characteristics, which apply to all end connection threads, are shown below for both male and female threads.

Threads

- | | |
|-------------------|-----------------------|
| 1. Crest | 5. Thread flank angle |
| 2. Root | 6. Taper angle |
| 3. Flank | 7. Male thread OD |
| 4. Pitch (metric) | 8. Female thread ID |

Male

Female

End Connections

1. Body size
2. Shoulder
3. Face

End Connection

Step-by-Step Identification Procedure for Threads and End Connections

Step 1: Determine if the thread is tapered or straight (parallel).

Step 2: Measure the thread diameter.

Step 3: Determine the thread pitch.

Step 4: Determine the thread standard.

Step 5: Identify the end connection.

Note: Even experienced workers sometimes have difficulty identifying threads, regardless of their thread identification procedure and the quality of their gauges.

Details

Step 1: Determine if the thread is
T tapered or S straight (parallel).

Use a caliper to measure the nominal male or female thread crest-to-crest diameter on the first, fourth, and last full threads (Fig. 1).

T If the diameters increase for a male end or decrease for a female end, the thread is tapered.

S If all the diameters are the same, the thread is straight (parallel).

Fig. 1
Measuring Crest-to-Crest Thread Diameters

Fig. 2
Measuring the Thread Diameters

Step 2: Measure the thread diameter.

Use a caliper to measure the nominal male or female thread diameter from crest-to-crest (Fig. 2).

T Measure the fourth or fifth full thread.

S Measure any full thread.

The diameter measurement obtained in this step may not be exactly the same as the listed nominal size for the given thread. The main reason for this variation is industry or manufacturing tolerances.

Step 3: Determine the thread pitch.

To determine the thread pitch, use the Swagelok® pitch gauges and check the thread against each form until you find a match. If you prefer to narrow down the choices, use the following procedure:

- a. On the appropriate thread identification reference table, locate the nominal thread diameter. Note that it is common to have the thread diameter for different threads listed multiple times.

T Turn to the **Tapered Thread Identification Reference Tables** beginning on page 13.

S Turn to the **Straight Thread Identification Reference Tables** beginning on page 15.

- b. For each case, read across the table to the pitch column to determine the possible thread pitches for your thread.
- c. Try the appropriate pitch gauge form for the threads identified in Step b. above until you find a match (Fig. 3).

Fig. 3.
Determining the Thread Pitch

Step 4: Determine the thread standard.

Once you have determined the following about a thread, you have all the information required to identify it:

- Male or female
- Straight or tapered
- Nominal male or female diameter
- Pitch

Now, turn to the appropriate thread identification reference table and identify the thread.

Step 5: Identify the end connection.

- T** If the thread is tapered:
- a. Locate the end connections that have the tapered thread you identified. (See pages 21 through 26.
 - b. Study the cross-section drawings for these end connections and determine which one matches your end connection.

S If the thread is straight:

- Locate the end connections that use the straight thread you identified. (See pages 27 through 50.
- Study the cross-section drawings for these end connections and determine which one matches your end connection.

Note: The Swagelok combination seat and pitch gauge set includes 45° , 37° , and 30° seat angle gauges to assist with end connection identification. (See page 53.)

- Select one of the gauges and place its angle against the seat angle of the end connection.
- If the center line of the fitting and the longitudinal axis of the gauge are parallel, the seat angle and the gauge angle are the same. If not, try another gauge.

Fig. 4
Determining Seat Angle

Note: Fittings have seat angles other than 45° , 37° , and 30° . Contact your authorized Swagelok sales and service center for additional information.

EXAMPLE:**Thread and End Connection Identification (Steps 1 to 5)**

You have a male fitting and you need to identify its thread.

Step 1: *Determine if the thread is tapered or straight (parallel).*

You find that the thread is straight.

Step 2: *Measure the thread diameter.*

You find the thread diameter to be 0.430 in.

Step 3: *Determine the thread pitch.*

- a. Because the thread is straight, turn to the **Straight Thread Identification Reference Table**, page 15, and locate the thread diameter. See section of table below.

Nominal Thread Size	Designation	Nominal Male Thread Diameter		Pitch ^①	Page
		in.	mm		
3/8	UNF	0.375 to 0.365	9.53 to 9.22	24U	30 to 35
	NPSM	0.658	16.71	18U	51
	ISO 228/1	0.656	16.66	19W	36 to 43
7/16	UNS	0.436 to 0.429	11.07 to 10.90	24U	30 to 35
	UNF	0.436 to 0.424	11.07 to 10.77	20U	30 to 35
1/2	UNF	0.500 to 0.487	12.70 to 12.36	20U	30 to 35
	NPSM	0.818	20.78	14U	51
	ISO 228/1	0.825	20.96	14W	36 to 43

① U = Unified W = Whitworth M = Metric
Labeling on each Swagelok pitch gauge form

- b. Look across the table to find the corresponding pitches. In this case, they are 20 and 24.
- c. Therefore, to determine the pitch of the thread you would use your 20 and 24 pitch gauges.

For the purposes of this example, assume that the pitch is 24.

Step 4: *Determine the thread standard.*

At this point you know that the thread has the following characteristics:

- a. Male
- b. Straight
- c. Nominal thread diameter of 0.430 in.
- d. Pitch equals 24

Looking at the cut-out portion of the straight thread identification reference table, you see that the only thread with all of these characteristics is a 7/16 in. UNS thread.

Step 5: *Identify the end connection.*

So far you know that you have a 7/16 in. UNS thread. To identify the end connection, you:

- a. Identify the type of seal.
- b. Turn to the **End Connections That Use Unified Screw Threads** section in this manual (pages 29 through 35, and find the configuration that matches your end connection.

Thread Identification Reference Tables

T Tapered—Male

Note: Measured thread diameters may not match table measurements exactly. All threads have tolerances regarding many parts of the threads. The information in this table is not intended to be used as inspection criteria for threaded fittings. It is intended to be used as a guide to help identify various threads.

Nominal Thread Size, in.	Designation	Nominal Male Thread Diameter		Pitch ^①	Page

Tapered Threads

The following characteristics and information should be considered when using tapered threads:

- The seal is designed to take place between the tapered threads.
- Tapered pipe threads always need a sealant to seal system fluids and reduce the potential for galling of the threads.
- Products such as Swagelok PTFE tape, SWAK™, anaerobic pipe thread sealant with PTFE, and PTFE Free pipe thread sealant perform both the lubricating and sealing functions. If the two pieces of metal are forced against each other without lubrication, galling is possible.
- After following the sealant and lubricant application instructions, the amount of tightening is discretionary. There is no standard for torque or number of turns.

Tapered Threads

NPT

(also known as
ASME B1.20.1)

Characteristics

- Tapered thread ($1^{\circ} 47'$)
- Truncation of roots and crests are flat
- 60° thread angle
- Pitch is measured in threads per inch

ISO 7/1

(also known as
EN 10226-1 and
JIS B0203)

Characteristics

- Tapered thread ($1^{\circ} 47'$)
- Truncation of roots and crests are rounded
- 55° thread angle
- Pitch is measured in threads per inch

End Connections That Use Tapered Threads

- **NPT**
- **NPT with O-Seal**
- **BSPT**

Nominal Size in.	Thread Size-Pitch		
	NPT	NPT with O-Seal	ISO 7/1
1/16	1/16-27	1/16-27	1/16-28
1/8	1/8-27	1/8-27	1/8-28
1/4	1/4-18	1/4-18	1/4-19
3/8	3/8-18	3/8-18	3/8-19
1/2	1/2-14	1/2-14	1/2-14
3/4	3/4-14	3/4-14	3/4-14
1	1-11.5	1-11.5	1-11
1 1/4	1 1/4-11.5	1 1/4-11.5	1 1/4-11
1 1/2	1 1/2-11.5	1 1/2-11.5	1 1/2-11
2	2-11.5	2-11.5	2-11

Note: 1/2 and 3/4 in. BSPT and NPT threads can be difficult to identify because they are very close in design. Positive identification may not be possible without the use of an optical comparator. Contact your authorized Swagelok sales and service center for additional information.

End Connections That Use
Tapered Threads

NPT

Seal Location	Applicable Standards	
	Fittings	Thread
On threads (sealant required)	NPT	ASME B1.20.1

- Male:** The male end has a 1° 47' tapered thread with a 60° thread angle.
- Female:** The female end has a 1° 47' tapered thread with a 60° thread angle.
- Seal:** The seal is designed to take place on the tapered thread.

End Connections That Use Tapered Threads

NPT with O-Seal

Seal Location	Applicable Standards	
	Fittings	Thread
O-ring compression	None	ASME B1.20.1

Male: The male end has an undersized NPT thread and an O-ring groove on the shoulder of the hex.

Female: The female end has an NPT thread and a smooth, flat surface.

Seal: The seal takes place by compressing the O-ring against the face of the female component.

End Connections That Use
Tapered Threads

BSPT

JIS R and JIS Rc

DIN 3852 Part 2, Type C

Seal Location	Applicable Standards	
	Fittings	Thread
On threads (sealant required)	JIS B8363 BS 5200 DIN 3852 Part 2	ISO 7/1

- Male:** The male end has a 1° 47' tapered thread with a 55° thread angle.
- Female:** The female end has a 1° 47' tapered thread with a 55° thread angle.
- Seal:** The seal is designed to take place on the tapered thread.

Straight Threads

Worldwide, there are many end connections available with straight threads. Each end connection, however, will generally have threads that are one of the three most common: ASME B1.1 (unified screw thread), ISO 228/1, or ISO 261 straight threads.

Because the threads of the mating fittings are parallel to each other, there is no interference between the flanks, crests, and roots. Consequently, the seal must be made with a gasket, O-ring, or some metal to metal contact. A sealant is not required or recommended on straight threads. Depending on the application and materials, thread lubricant may be used.

Unified Screw Thread

(also known as ASME B1.1)

Characteristics

- Straight thread
- Truncation of roots and crests are flat
- 60° flank angle
- Diameter and pitch measured in inches

Thread Series

- UN: Male and female screw thread
- UNR: Male screw thread only (more rounded crest)
- UNC/UNRC: Coarse thread series
- UNF/UNRF: Fine thread series
- UNEF/UNREF: Extra-fine thread series
- UNS/UNRS: Selected special combinations of diameters, pitches, and lengths of engagement.

Straight Threads

ISO 228/1

(also known as BSPP, JIS B0202)

Characteristics

- Straight thread
- Truncation of roots and crests are rounded
- 55° flank angle
- Threads are measured in inches

Metric

(also known as ISO 261, JIS B0205, ASME B1.13M)

Characteristics

- Straight thread
- Truncation of roots and crests are flat
- 60° flank angle
- Threads are measured in millimeters

NPSM

(also known as ASME B1.20.1)

Characteristics

- Straight thread
- Truncation of roots and crests are flat
- 60° flank angle
- Threads are measured in inches

End Connections That Use Metric (ISO 261) Threads

DIN 7631

Seal Location	Applicable Standards	
	Fittings	Thread
Globe seal nose tapered angle	DIN 7631	Metric (ISO 261)

Male: The male end has a straight thread and a 30° taper.

Female: The female end is a nut with a straight thread captured on a globe seal nose gland. The globe seal nose may contain an O-ring.

Seal: The seal takes place between the taper in the male fitting and the globe seal nose.

End Connections That Use
Metric (ISO 261) Threads

JIS Parallel Pipe Metric

Seal Location	Applicable Standards	
	Fittings	Thread
Mating 30° angled surfaces	JIS B8363	Metric (ISO 261)

- Male:** The male end has a straight thread and a 30° taper.
- Female:** The female end is a nut with a straight thread captured on a 30° cone tapered gland.
- Seal:** The seal takes place between the taper in the male fitting and the 30° cone tapered gland.

End Connections That Use Metric (ISO 261) Threads

DIN EN 837-1 and DIN EN 837-3, Type B

Female^①

Female^②

Seal Location	Applicable Standards	
	Fittings	Thread
Gasket compression	DIN EN 837-1 and DIN EN 837-3	Metric (ISO 261)

- Male:** The male fitting has a straight thread and a spigot which fits through the inside diameter of the gasket.
- ① Female:** The female has a straight thread and a counterbore in the inside diameter of the fitting to accept a gasket.
- ② Female:** The female has a straight thread and a counterbore in the inside diameter of the fitting to accept a gasket. The counterbore is larger to help ensure the male end compresses the gasket into a sealing position.
- Seal:** The seal takes place by compressing a gasket between the male and female fittings.

End Connections That Use Metric (ISO 261) Threads

DIN 3852 Part 1, Type A

Seal Location	Applicable Standards	
	Fittings	Thread
Gasket compression	DIN 3852 Part 1	Metric (ISO 261)

Male: The male end has a straight thread and a straight shoulder.

Female: The female end has a straight thread and a flat, smooth surface.

Seal: The seal takes place by compressing a gasket between the straight shoulder and the flat, smooth surface.

Gasket: This gasket could be either all metal or metal with a bonded elastomer on the inside diameter.

End Connections That Use Metric (ISO 261) Threads

DIN 3852 Part 1, Type B

Seal Location	Applicable Standards	
	Fittings	Thread
Gasket metal-to-metal	DIN 3852 Part 1	Metric (ISO 261)

Male: The male end has a straight thread and an angled shoulder.

Female: The female end has a straight thread and a flat, smooth surface.

Seal: The seal takes place by compressing a gasket between the angled shoulder and the flat, smooth surface.

Gasket: Use of a metal gasket is suggested.

End Connections That Use Metric (ISO 261) Threads

ISO 6149-1, ISO 6149-2, AND ISO 6149-3

Seal Location	Applicable Standards	
	Fittings	Thread
O-ring compression	ISO 6149-1, ISO 6149-2, ISO 6149-3	Metric (ISO 261)

Male: The male end has a straight thread and an O-ring.

Female: The female end has a straight thread and a taper to accept the O-ring.

Seal: The seal takes place by compressing the O-ring into the taper.

End Connections That Use NPSM Threads

Thread Identification Tools

Caliper

A caliper is used to determine the thread diameter. (Calibration of calipers is the responsibility of the end user.)

Combination Seat and Pitch Gauge

Seat and pitch gauges are conveniently combined into one tool.

The seat gauge is used to determine end connection seat angles of 45°, 37°, and 30°.

The pitch gauge is used to identify the thread pitch. Note that a pitch gauge may be Unified (threads per inch), Whitworth (threads per inch), or metric (millimeters per thread) as marked on the back of each gauge form.

Safe Product Selection

When selecting a product, the total system design must be considered to ensure safe, trouble-free performance. Function, material compatibility, adequate ratings, proper installation, operation, and maintenance are the responsibilities of the system designer and user. The complete catalog contents must be reviewed to ensure that the system designer and user make a safe product selection.

WARNING

Do not mix/interchange Swagelok products or components not governed by industrial design standards, including Swagelok tube fitting end connections, with those of other manufacturers.

Warranty Information

Swagelok products are backed by The Swagelok Limited Lifetime Warranty. For a copy, visit swagelok.com or contact your authorized Swagelok representative.
